

SCALE TRACK / TESTNET PROTOTYPE

CONDUIT

Your money. Your rules.

A programmable TRY–Stellar rail.

Bank connections are simulated through a TRY mock anchor.

THE SOLUTION

Set the rule. Keep control.

Allocate incoming USDC automatically.
Keep the assets in your own wallet.

- 01 You choose**
Assets, spending cap and expiry.
- 02 The contract checks**
Each swap must fit your mandate.
- 03 You can revoke**
Stop the delegate with one call.

The delegate can request a swap.

The contract fixes the payout recipient to the owner.

PMF

Money follows a plan. People watch the screen.

Initial audience: people managing money across TRY and USDC.

01

Repeat decisions

Every incoming payment means allocating again.

02

Manual execution

Someone must return to the wallet to act.

03

Broad permissions

A funded bot controls the budget it receives.

ILLUSTRATIVE FREELANCER RULE

100 USDC arrives → 40% XLM + 30% AQUA + 30% USDC

PMF hypothesis: recurring allocation is valuable enough for repeat use.

TECHNICAL WORKFLOW

From a deposit to a bounded swap.

One atomic execution: pull funds → swap → return proceeds.

- TODAY Testnet • mock bank rail • open browser tab required
- SCOPE Mandate protection is active in portfolio mode.
- NEXT Background execution + production anchor integration

THE TEAM

The logo consists of the letters 'MK' in a bold, yellow, sans-serif font, centered within a black square.

Murat Keskin

Project author / full-stack development

Soroban contract · Stellar integration · product interface

Built from the rule engine to the on-chain mandate.

NEXT MILESTONE

Validate recurring use. Bring the rail to a production anchor.
